Title : A Study of Morphological and Antigenic Properties of  
Animal Organs and Tissues in Ontogenesis.  
(Izucheniye morfologicheskikh i antigennykh svoystv or-  
ganov i tkaney zhivotnykh v ontogeneze).

Orig Pub : V sb.: Probl. sovrem. embriologii. L., Un-t, 1956,  
317-321

Abstract : Using an anaphylactic reaction with desensitization on  
guinea pigs it was shown that at all stages of develop-  
ment the crystalline lens tissue of the Peking duck  
possesses an antigenic species specificity, which is  
most marked at earlier stages of development. Organos-  
pecific antigens (A) of a definitive crystalline lens  
are found in the crystalline vesicles of embryos 90

Abstract          : The territories of the Dagestan, North Oset'a, Kabarda Autonomous  
Republics and of Groznenskaya Oblast' and Stavropol'skiy Kray  
were visited in summer of 1953 by an expedition of the Geological  
Faculty. The main problem was the mesozoic deposits, namely the  
detailed stratigraphy and lithology of North Caucasus formations.  
Participating included Docents M. M. Moskvina, G. P. Leonov, I. A.  
Konyukhov and Prof. I. O. Brod.

ABSTRACT: Two large-scale lithologic groups are distinguished in the Lower Cretaceous: a lower, chiefly calcareous (Valanginian, Hauterivian, and lower Barremian), and an upper, sandy-silty-clayey (from lower Barremian to Albian, inclusively). The Valanginian in southern Dagestan (basin of the Samur River) is predominantly dolomite. In the basin of the Tsmur-chay River it is granular dolomite and limestone in the lower part, limestone higher up, and dolomitized limestone still higher. In the remaining part of central and north-western Dagestan, lithographic, granular, and pseudo-

PERIODICAL: Novosti neft. tekhn. Geologiya, 1956, Nr 1, pp 26-30

ABSTRACT: The author reports the results of an eight-year study  
on the fluorescent-bitumenol peculiarities of the  
Mesozoic deposits in 136 sections from a region  
extending from the Samur River on the east to the  
Kuban' River on the west. The total number of  
fluorescent-bituminol analyses, made in the last three  
years, exceeded 6000. Only free bitumin "A" was  
studied. It is shown that the Middle Jurassic clastic  
rocks are distinguished by a higher content of bitumen

TITLE: The Lithologic Features of the Lower Cretaceous Rocks  
of Dagestan (Litologicheskiye osobennosti nizhnemelovykh  
otlozheniy Dagestana)

PERIODICAL: Izv. AN AzSSR, 1956, Nr 9, pp 33-47

ABSTRACT: In the thick sequence of Lower Cretaceous rocks in  
Dagestan, two large-scale lithologic groups are clearly  
distinguished: a lower, chiefly calcareous (Valan-  
ginian, Hauterivian, and lower Barremian), and an upper,  
predominantly sandy-silty-clayey (upper Barremian,  
Aptian, and Albian). The carbonate rocks of the cal-  
careous group are organic-clastic, oolitic, litho-  
graphic, and granular limestones. In the upper  
Barremian, Aptian, and Albian rocks, clastics pre-  
dominate, consisting of interbedded sandstones, con-  
solidated sands, siltstones, and clays. The greatest

The Lithologic Features of the Lower Cretaceous (Cont.)

facies variability is found in Neocomian deposits. The author  
associates this variability with large uplifts in the Caucasus land  
mass, which had arisen in Upper Jurassic time. In the Aptian and  
Albian, widespread transgression took place, leading to extensive  
accumulation of clastic sediments.

PHASE I BOOK EXPLOITATION

SOV/2197

Opyt izucheniya mezozoyskikh otlozheniy Vostochnogo Predkavkaz'ya; v svyazi s perspektivami neftegazonosnosti (Study of Mesozoic Deposits in Eastern Ciscaucasia; Oil- and Gas-bearing Possibilities) Moscow, GosintI, 1958. 125 p. Errata slip inserted. 1,550 copies printed.

Sponsoring Agencies: RSFSR. Gosudarstvennyy nauchno-tekhnicheskii komitet, and Gosudarstvennyy nauchno-issledovatel'skiy institut nauchnoy i tekhnicheskoy informatsii.

Ed.: I. O. Brod; Executive Ed.: I. N. Tareyev; Tech. Ed.: Ya. M. Masolov.

PURPOSE: This book is intended for petroleum geologists and area specialists interested in the North Caucasus region.

COVERAGE: This book presents the results of geologic and paleontologic investigations of the sediments of the North Caucasus made to ascertain the presence and extent of oil-bearing deposits. Stratigraphic and lithologic studies made possible a more exact classification of the deposits and a more complete understanding of their composition, facies changes, and oil- and gas-bearing potential. Studies were carried out under the direction of professor I. O. Brod by the Department of Petroleum and Gas Geology of MGU (Moscow State University), VNIIGaz, and the SKNE (Combined North Caucasus Oil Expedition).

TITLE: On some properties of the positive column of a tubular discharge

PERIODICAL: Referativnyy zhurnal, Fizika, no. 7, 1962, 55, abstract 7Zh368  
("Nauchn. tr. Tul'sk. gorn. in-ta", 1961, sb. 3, 106 - 110)

TEXT: The boundary conditions usually utilized at the elaboration of the theory of the positive column of a tubular discharge do not yield a correct dependence of the eigenvalues of the boundary problem upon the discharge parameters. In the positive column of an axially symmetrical discharge between coaxial cylinders there is a maximum of the concentration of the charged particles, the position of the maximum depending on the magnitude of the eigenvalues. The connection of the latter with the discharge parameters allows to choose the necessary boundary condition. The solution of the balance equation of the charged particles for the stationary state under quasi-neutral ambipolar diffusion conditions is sought in the form of a linear combination of zero-order Bessel functions of the first and second kind. The Schottky condition yields the dependence of the con-

centration maximum upon the radii of the limiting cylinders. The eigenvalues at the Van-de-Groot boundary condition depend on the discharge parameters and can be found from measurements of the potential difference between the walls, the electron temperature and the position of the maximum. The possibility is indicated of utilizing the tubular discharge for the study of the relation between the volumetrical and surface losses. +

Title : On Solar Radiation as a Zooclimatic Factor (O solnechnoy radiatsii kak zooklimaticheskoy faktore)

Orig Pub: Tr. Kazakhsk. n.-i gidrometeorol. in-ta, 1957, vyp. 8, 100-104

Abstract: The results of the observations of the influence of the intensity of solar radiation on the condition and behavior of sheep are discussed. On the flat lowland pastures (altitude 200-600 m.), on fair sunny days with low wind, air temperature at 25°C and over proved to be unfavorable for sheep. At the altitude of 2,200-2,500 m., in similar weather, the air temperature of 17-18°C was found to be not suitable for sheep.
